FS-FOR-FUN.mp4 LS-Land-Issue-LS-Magazine-LS-Models-LS-Dreams-Reallola-and-BD-Company-Video-Series-f5.1.txtHello all, the next two weeks is going to be busy as I have to study for an upcoming test I have for my MS degree. Here's the latest release. Thank you all for your feedback. Cannot clone a node named "%4\$s" in list of nodes "%3\$s". If a plant appears anywhere in the world, you have to bring it home somehow, right? Today, I am finally, finally getting around to say that the roots are also okay to be brought home. The general idea is that you can take clones from a plant, and then use them to clone a plant of your own. The clone will be able to start growing roots of it's own, but the plant will still not be producing any fruit as it has not been correctly fertilized. Why is this called a "pollination" system? There is no pollination involved. How it works is in the "flowering" stage, the clones are the only ones to become pregnant and the only ones that produce fruit. There are currently only two ways to change this. Change the pollination method. Now, that is a whole project in it's own right. Why are the clones male and female? The clones I created in this project are gynodioecious, meaning that they are male and female. Gynodioecy simply means that the plants are both male and female, they are both functional. All plants in real life are gynodioecious. When a plant is gynodioecious, plants of each gender have both male and female flowers, and each plant only produces males or females based on which gender it receives more pollen. The clones themselves are male, but not the plants they fertilize. The clones themselves do not produce any pollen. How did they get the seeds? The clones produced seeds without being fertilized. Each plant starts life with a full set of seeds, which of course they won't produce fruit. Seeds should never be harvested until the plant begins to flower. How do I get the clones to fertilize the other clones? The clones fertilize themselves during a period of time that is of no
